

InterfaX

A Task Oriented Desktop by EnceladOnline

Welcome to InterfaX !

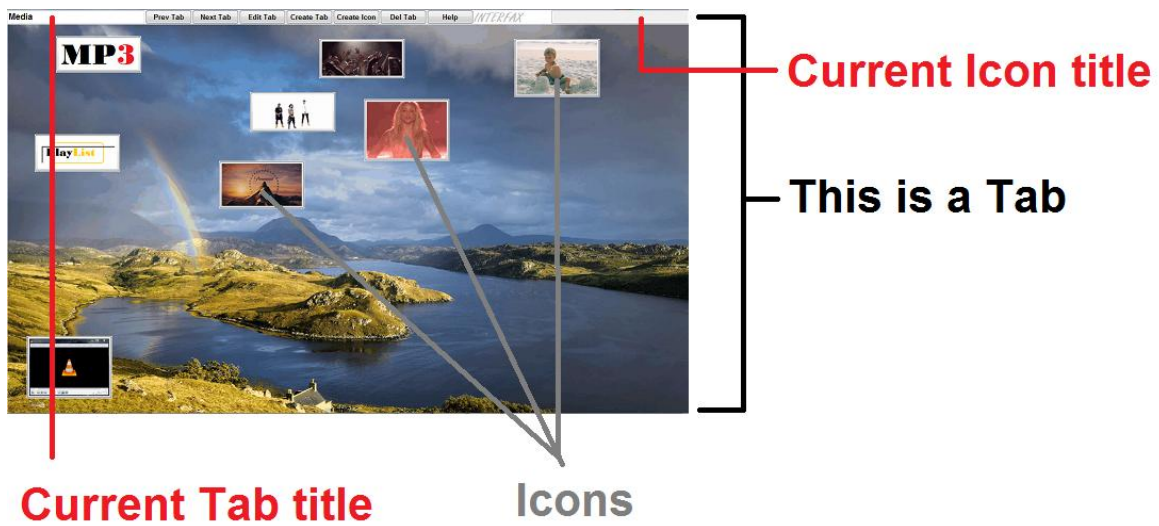

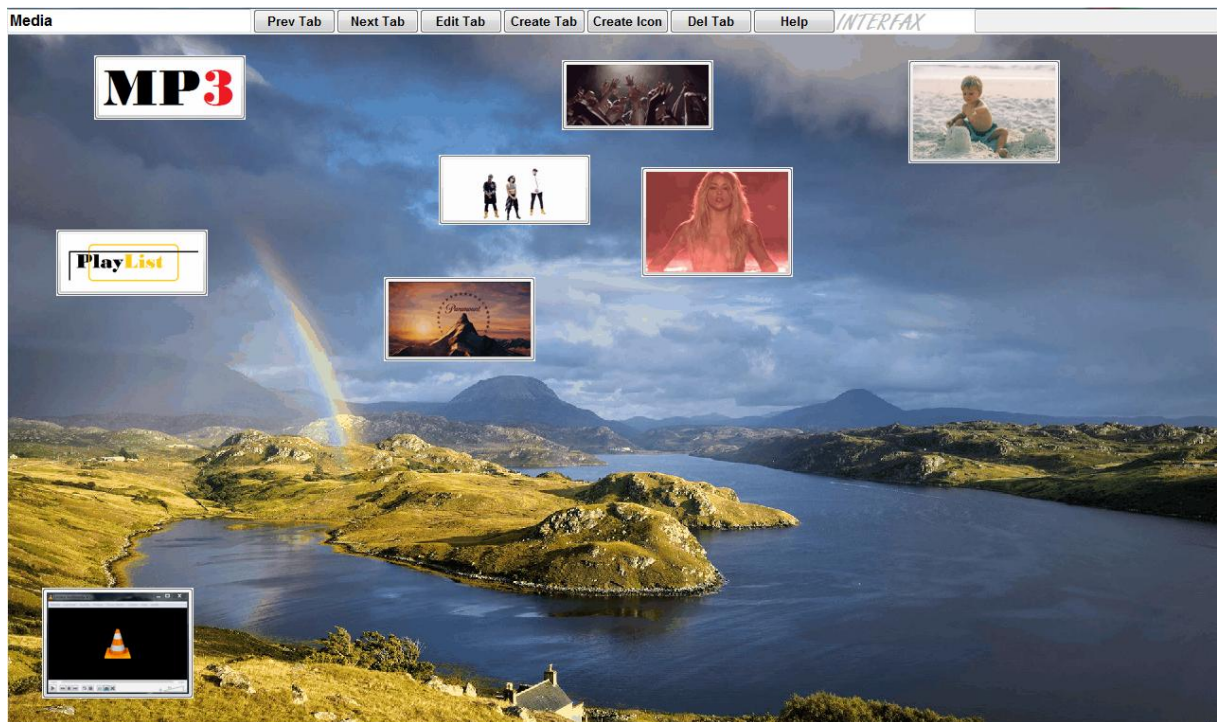

This little script let you use a virtual desktop in another way than the classical one implemented natively on your computer.

Now you own a task oriented desktop.

In just one click on the InterfaX Next or Prev Button, you can jump from your drawing task's tab (a tab which let you have under hand your favorites drawing tools) to maybe let choose randomly... to your internet area's tab (a tab with maybe your favorites browsers or tools related to internet).

Actually, InterfaX is just another way to organize your data. InterfaX doesn't pretend to replace your native desktop, so keep it relax, just smile ! 😊

The graphical user interface:

What is a Tab ?:

A tab is the metaphore of a specific task's desktop.

You can put Icon on the Tab, choose a wallpaper for your Tab.

What is an Icon?:

An Icon is simply a file or directory or tool that you add on a Tab.

How can I make a Tab or an Icon?:

Simple, press the button Create Tab to make a new tab or press the right button of your mouse on InterfaX to add an Icon (You must make a Tab before create an Icon).

To modify an Icon, just a right click on it.

You can move an Icon by pressing the button Drag which is on Icon menu (right click on button), to stop the Drag you have just to press Enter on your keyboard

That is enough, InterfaX is a friendly-like app, you can't get confused ! Enjoy it ! Bye !

Thanks To: Python, FSF, PIL.
